Chapter 1

INTRODUCTION

Company Profile

Land Transportation Franchising and Regulatory Board - Region 1 in San Fernando, La Union is a regional office of the LTFRB responsible for overseeing land transportation operations within the Region 1 area, which includes the provinces of Ilocos Norte, Ilocos Sur, La Union, and Pangasinan.

Land Transportation Franchising & Regulatory Board (LTFRB) ensures that the commuting public is provided with adequate, safe, convenient, environment-friendly, and dependable public land transportation services at reasonable rates. The LTFRB envisions a future where world-class land transportation services play a pivotal role in the overall development of the country. These services contribute to the enhancement of the socio-economic status of all stakeholders involved, while simultaneously promoting the welfare of the general public. LTFRB mandates to promulgate, administer, enforce, and monitor compliance of policies, laws, and regulations of public land transportation services.

Situation Analysis

In today's era, the need for technology to digitize processes has become increasingly apparent. Technology allows for greater efficiency, accuracy, and accessibility in various aspects of life. From businesses to healthcare, education to government services, the digitization of processes has proven to streamline operations and improve user experience. By integrating technology into manual processes, organizations can automate repetitive tasks, reduce human error, and improve overall productivity. This can lead to cost savings, faster turnaround times, and better utilization of resources.

In the USA, vehicle franchise management systems exist, but they differ from government-issued public transportation franchises like those overseen by the LTFRB in the Philippines. Many USA vehicle franchise opportunities lie within the service sector, offering established brand names and operational frameworks to franchisees. Franchises in the USA focus on providing specific services for vehicles. Examples include Fix Auto (collision repair), Auto Butler (mobile detailing), and Caliber Collision Centers (collision repair). USA franchise management system is a comprehensive platform designed to support franchise owners in managing their operations efficiently. It encompasses various aspects such as inventory management, customer relations, financial reporting, and managing their operations efficiently. It encompasses various managing their operations efficiently. It encompasses various aspects

such as inventory management, customer relations, financial reporting, and operational workflows. The system aims to streamline processes, enhance productivity, and maintain consistent standards across all franchise locations (Cochinwala, 2023).

The tricycle transportation system in Binan City, Philippines, managed by the Binan Tricycle Franchising and Regulatory Board (BTFRB), operates with manual processes, leading to inefficiencies and difficulties in monitoring franchise statuses and violations. With over 4,450 registered tricycle franchises and an average daily clientele of 30 operators, there is a clear need for modernization. Developing a web-based management system with SMS and email notification capabilities presents an opportunity to streamline processes, improve data integrity, and enhance customer service. By automating record-keeping and renewal processes, the proposed system aims to reduce wait times and improve overall compliance with regulations, benefiting both BTFRB staff and tricycle operators. In summary, this project addresses critical challenges in tricycle management, aligning with the city's goal of efficient and effective transportation services (Himo et al.,2022).

Currently, Land Transportation Franchising and Regulatory Boards - Regional Office 1 do not have a digitalized system for processing their franchise services. The agency follows their existing citizen's charter regarding the manual process of managing franchise applications of

clients. For example, when acquiring a new certificate of public convenience, the operator is required to comply with the needed requirements. The client will then put it in a folder which will be passed to the technical department of the agency. The technical department will be validating if there is a missing requirement/document. If none, the technical department will send the folder to the legal side for the next process. Most of the folders are sorted out using a shelf with different labels (for hearing, incomplete requirements, to be sent to the central office, etc).

In the province of La Union, The Office of the Provincial Governor - Information and Communication Technology Unit (OPG-ICTU) conducted three end-users training vis-a-vis three new in-house developed systems for the Provincial Government of La Union (PGLU) as part of the first 100-days commitment of the Governor Raphaelle Veronica “Rafy” Ortega-David's commitment for her P.U.S.O. Agenda.

The first system is the Document Tracking System designed to track, file, retrieve, and monitor documents such as memorandums, communication letters, and financial documents. On September 29, 2022, ICTU held end-user training for the aforementioned system on the 4th Floor, LUPOS Building, Barangay Sevilla, San Fernando City, and La Union. On October 10, the launching of the said system commenced.(Ebreo, 2022)

Conceptual Framework

Land Transportation Franchising and Regulatory Board 2020 Citizen's Charter (2nd Edition) was drafted based on the existing LTFRB Citizen's Charter as required under Republic Act No. 9485 otherwise known as the Anti-Red Tape Act, in consultation with LTFRB employees and stakeholders; and previous LTFRB Memorandum Circulars, Office Orders, Resolutions and other issuances have provisions contrary to or inconsistent with the provisions and requirements of the 2017 LTFRB Citizen's Charter.

Information System (IS) Success Model (2003) was authored by Delone and McLean. The framework is a popular methodology for assessing how well information systems (IS) are performing inside businesses. According to the paradigm, IS success is a multifaceted concept made up of six dimensions: individual impact, organizational impact, system quality, information quality, use, and user satisfaction. The researcher will employ DeLone and McLean IS Success Model (2003) to evaluate and enhance the quality and effectiveness of the PUV franchise management system in managing client's application forms.

Integrating constructs of the technology acceptance model and total quality management to improve document management performance. A study about the acceptance of technology in document management. The study results agree on emerging technology to

document management using various gathering methods like individual interviews, focus group discussions, and questionnaires from a total of 186 respondents. The study talks about how the attitude of the users towards the document management system, its Perceived Cost, Perceived ease of use, Perceived Usefulness, Satisfaction and Enjoyment, their Response on Subjective Norms, Response on Behavioral Control, Response on Perceived Security, Assessing Perceived Risk, Perceived Compatibility, Individual Mobility, and Response to Personal Innovativeness. In Summary, the respondents embraced the emerging technology on a daily basis to increase efficiency by using Document Management Systems.

Problem Definition

The researchers proposed a Public Utility Vehicle Franchise Monitoring and Management System for Land Transportation Franchising and Regulatory Board to solve existing problems faced by technical side employees and legal side employees.

The problems encountered are:

- 1. Difficulty in Document Validation** - Reviewing documents if they are incomplete takes too much time due to documents being stored in a physical storage, manually rummaging through a mound of files results in delays in document validation.

- 2. Data storage inefficiency** - All the data in regard to public utility vehicle franchises is currently stored in physical documents and files, making it difficult to access and manage the information efficiently.
- 3. Difficulty in monitoring violations of PUV operators** - PUV operators who violate the rules may not receive the appropriate punishment because data and document recording are done manually. This could lead to unreported infractions, which would allow PUV operators with infractions to pass.
- 4. Time-consuming in searching and sorting of documents based on status** - Due to manual process in recording of documents and information of the clients, delays are to be expected on searching, for thousands of data are stored in a storage room or cabinet. It creates confusion and is time consuming when specific data are needed. Thus, creating inconvenience to the office and to the one who needs the document.

Objectives of the Study

The primary objective of this project is to develop a Public Utility Vehicle Franchise Monitoring and Management System for Land Transportation Franchising and Regulatory Board.

Specifically, the study aims to:

1. Develop a system that takes clients' information and documents in a form to be reviewed if all documents and data are clear and complete. If incomplete, the system will label the document as incomplete.
2. Develop a system with a normalized database for public utility vehicle franchise information. Database contains tables for storing information such as public utility vehicle details, operator information, franchise information, route details and compliance records.
3. Develop a system that displays PUV operator infractions, the time the infraction occurred, and the appropriate time for the operator to file an appeal. If violations have occurred, the renewal of the franchise will not proceed.
4. Develop a system with real-time monitoring feature that will allow the Land Transportation Franchising and Regulatory Board to track the status of each public utility vehicle franchise in real time. This feature could include status and

renewal processes, and automated notifications for pending or expired franchises.

Project Description

The proposed Public Utility Vehicle Franchise Monitoring and Management System establishes a computerized system for the Land Transportation Franchising and Regulatory Board to improve the franchising process for PUVs.

In the proposed system, there are three users namely; Admin, Technical section, Legal section. The Admin needs an account to access the system. The Admin generally executes all features of the system: (1) Manage Users which the admin can add, edit, and view for a user. In this feature, the admin can choose to add, edit, and view for an admin and employee. (2) Manage Role which the admin can add, edit, and view for a role. (3) Manage Department which the admin can add, edit, and view for a profile. (4) Manage Applicant documents in which the admin can add documents submitted by applicants as part of their franchise application, edit document status (if complete or not), and view specific documents. The addition of documents through scanner. (5) Manage Hearing in which the admin can add, edit hearing details, and view for specific hearings based on different criteria, such as hearing dates, applicant/operator names, or hearing outcomes. The admin can also

archive hearings. (6) Manage PUV which the admin can add, edit, and view specific PUV. (7) Manage PUV Violation in which the admin can add, edit, and view a vehicle violation. (8) Utilities which the admin can manage profiles, services, document types, application statuses, hearing statuses, activity log and perform backup and restore operations. (10) Reporting and Analytics which the admin can generate reports summarizing the status of franchise applications, document monitoring activities, and hearing processes.

As for the technical section, it can only access some of the features with limitations. The employee is also required to login. (1) Manage Applicant documents in which the employee can add documents submitted by applicants as part of their franchise application, update document status (if complete or not), and view specific documents. (2) View PUV which the employee can view specific PUV. (3) View PUV Violation in which the employee can view a specific vehicle violation. (4) Report and Analytics in which the employee can also generate reports based on specific parameters.

As for the legal section, it can only access some of the features with limitations. The employee is also required to login. (1) View Applicant documents in which the employee can view a specific applicant document. (2) Manage Hearing in which the employee can add, update hearing details, and search for specific hearings based on different

criteria, such as hearing dates, applicant names, or hearing outcomes.

(3) View PUV which the employee can view specific PUV. (4) View PUV Violation in which the employee can view a specific vehicle violation. (5) Report and Analytics in which the employee can also generate reports based on specific parameters.

Hardware and Software Requirements

Hardware Requirements

Hardware	Server	Client
Processor	At least i3 Processor Speed 3.5 GHz	At least Pentium 4 Processor Speed 3.5 GHz
RAM	At least 8 GB	At least 4 GB
Hard Drive	At least 1 TB	At least 500 GB
Scanner	Printer with Document Scanner	

Software Requirements

Software	Server	Client
----------	--------	--------

Operating System	At least Windows Server 2016	At least Windows 10
Web Browser	Google Chrome	Google Chrome
Database Software	MySQL	
Database Server	XAMPP	

Limitation of the Study

1. The system is not mobile responsive.
2. The system only manages the PUV of LTFRB - Regional Office 1.

Chapter 2

DATA GATHERING METHODS

Research Design

Descriptive and developmental research designs were utilized in conducting this study. Descriptive research allows for a wide range of data collection methods, including surveys, observational studies, case studies, and focus groups, making it a flexible and versatile research method. The information gathered through descriptive research can serve as a baseline for future research and provide a foundation for further studies (Sirisilla, 2023).

According to Richey (1994, as cited in Tolentino, 2023), developmental research is defined as "a systematic study of designing, developing, and evaluating instructional programs, processes, and products that must meet criteria of internal consistency and effectiveness. In addition, it is a way to establish new procedures, techniques, and tools based upon a methodical analysis of specific cases".

Primary Sources of Data

Interview

Information was gathered through the use of an interview. The

researchers conducted an initial interview with the Land Transportation Franchising and Regulatory Board - Region 1. The interview was conducted face-to-face on the 2nd of February, 2024, and 23rd of May, 2024 to which the Head of the Legal Section was informed about the purpose of the study, ensuring confidentiality, and maintaining anonymity of the interview. The interview was beneficial to the researchers which serves as their guide in developing the proposed system.

Documentary Analysis

The Legal Section Head of Land Transportation Franchising and Regulatory Board of Region 1 provided a Citizen's Charter. The Citizen's charter is a statement of promises given by a government agency to people or client groups regarding the services that they offer. It contains information such as the process of renewing the franchise of PUV, Application for franchising, Registration of PUV, etc. The provided Citizen's charter is used by the researchers to analyze the process of registration and renewal of PUV in technical section and in legal section.

Questionnaire

Information was collected through the use of a questionnaire. The researchers sent a questionnaire through email that was provided by

Atty. Mark Anthony Espenilla of the Land Transportation Franchising and Regulatory Board (LTFRB) - Regional Office No. I. The questionnaire was sent and retrieved via email on May 1, 2024. The questionnaire that was retrieved is used by the researchers to understand about the current situation of the office.

Secondary Sources of Data

Internet

Government websites, blogs, online articles, and other online resources contributed to the gathering of various information for this research.

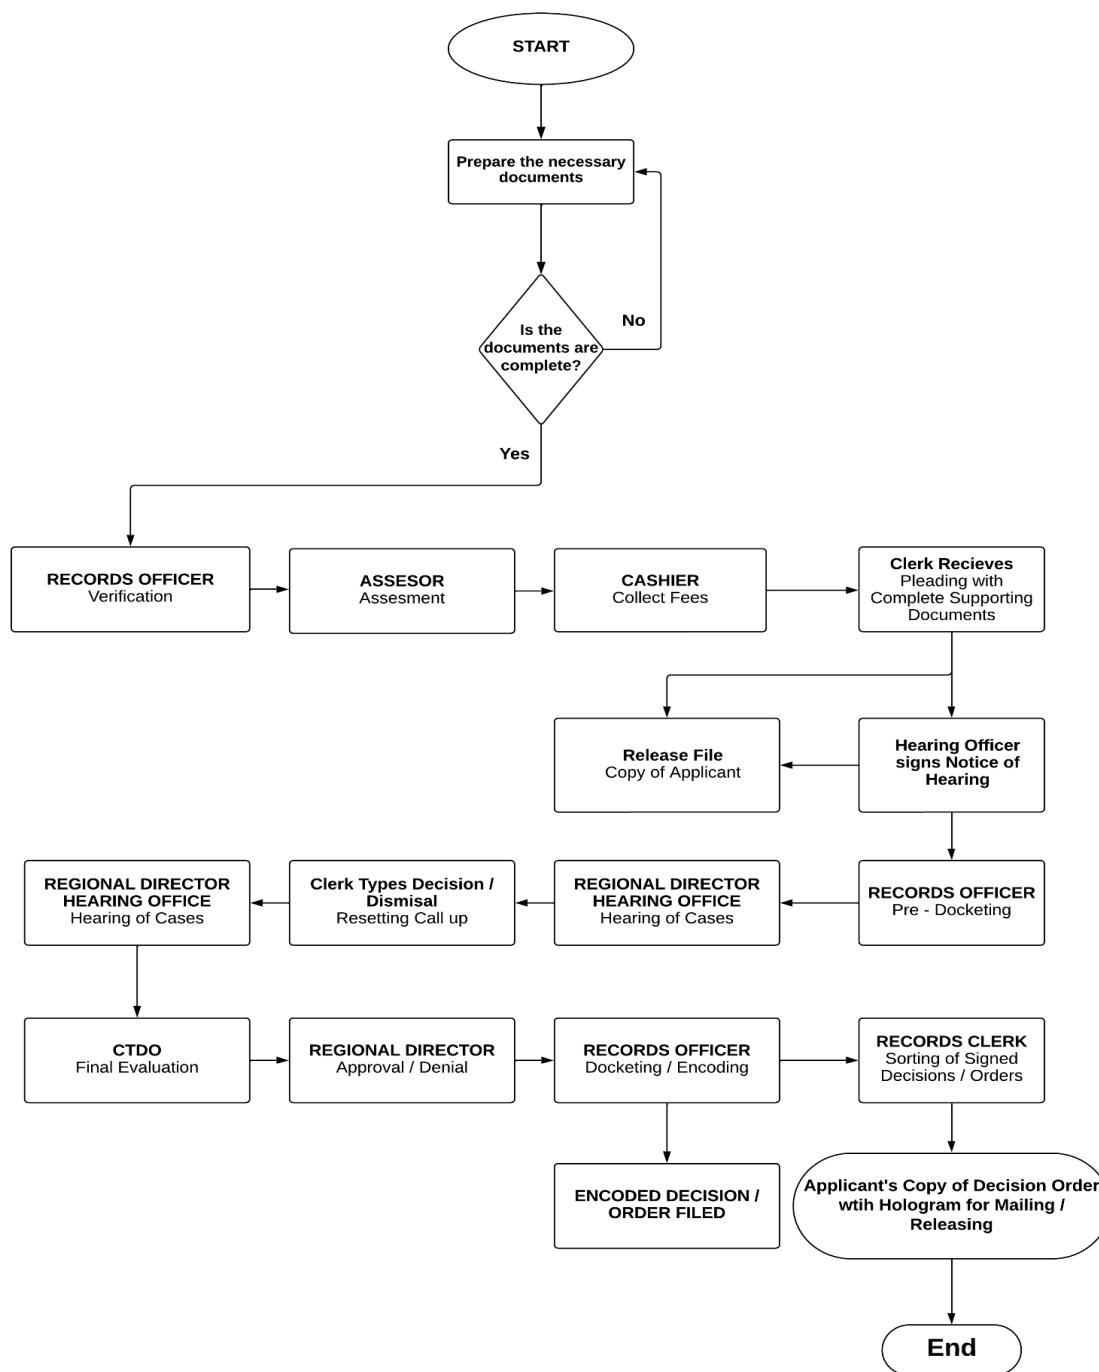

Unpublished Materials

The researchers utilized unpublished materials such as capstone projects and previous research manuscripts related to the study as a reference to gain additional insights and relevant information.
